## Geometry SOL Practice <br> Topic \#7: Triangle Inequalities <br> Notes

I. Given 3 segment lengths, will they make a triangle?

| Generalization | Example | Example |
| :---: | :---: | :---: |
| Given: short side, middle side, long side <br> If short side + middle side $>$ long side then YES a triangle can be form. Otherwise, NO. | $\begin{aligned} & \text { Given: } \\ & \text { side } 1=8 \text { inches } \\ & \text { side } 2=10 \text { inches } \\ & \text { side } 3=7 \text { inches } \\ & \text { Is } 8+7>10 \text { ? } \\ & \text { Is } \quad 15>10 \text { ? } \rightarrow \text { YES } \end{aligned}$ | $\begin{aligned} & \text { Given: } \\ & \text { side } 1=16 \text { inches } \\ & \text { side } 2=5 \text { inches } \\ & \text { side } 3=9 \text { inches } \\ & \text { Is } 5+9>16 \text { ? } \\ & \text { Is } \quad 14>16 ? \rightarrow \text { NO } \end{aligned}$ |

II. Given 2 sides of a triangle, what is the range of the third side?

Generalization
Example

Example

Given: side 1 and side 2
| side 1 - side 2 | side 3 < side $1+$ side 2 or
subtract the sides $<$ side $\mathbf{3}<$ add the sides

Given:
side $1=11$ inches
side $2=15$ inches

$$
\begin{aligned}
15-11 & <\text { side } 3
\end{aligned}<15+11
$$

[Side 3 is between 4 and 26 inches.]
III. Given the sides of a triangle, list the angles in order of size.

Given the angles of a triangle, list the sides in order of size.

Generalization

## Example

Given: $\mathrm{m} \angle \mathrm{B}=67^{\circ}$ and $\mathrm{m} \angle \mathrm{C}=40^{\circ}$
List the sides in order from shortest to longest.
[ note: $\mathrm{m} \angle \mathrm{A}=180^{\circ}-67^{\circ}-40^{\circ}=73^{\circ}$ ]

solution: $\mathbf{A B}<\mathbf{A C}<\mathbf{B C}$
